Primary Agentic AI Safety Challenges

Data leaks and bypassed protections expose sensitive information and enable model exploitation

1

Data Security Exposure

"52% of data breaches involve some form of customer PII." IBM Report

NeMo Safe Synthesizer

NeMo Anonymizer

2

Model Security Risks

"97% of companies with AI breaches had no AI access controls in place." IBM Report

Nemotron PII

NVIDIA NeMo Guardrails

Build enterprise-grade AI agents with robust security and control – intercept policy violations with minimal performance impact

Key Features

Customizable Use Cases

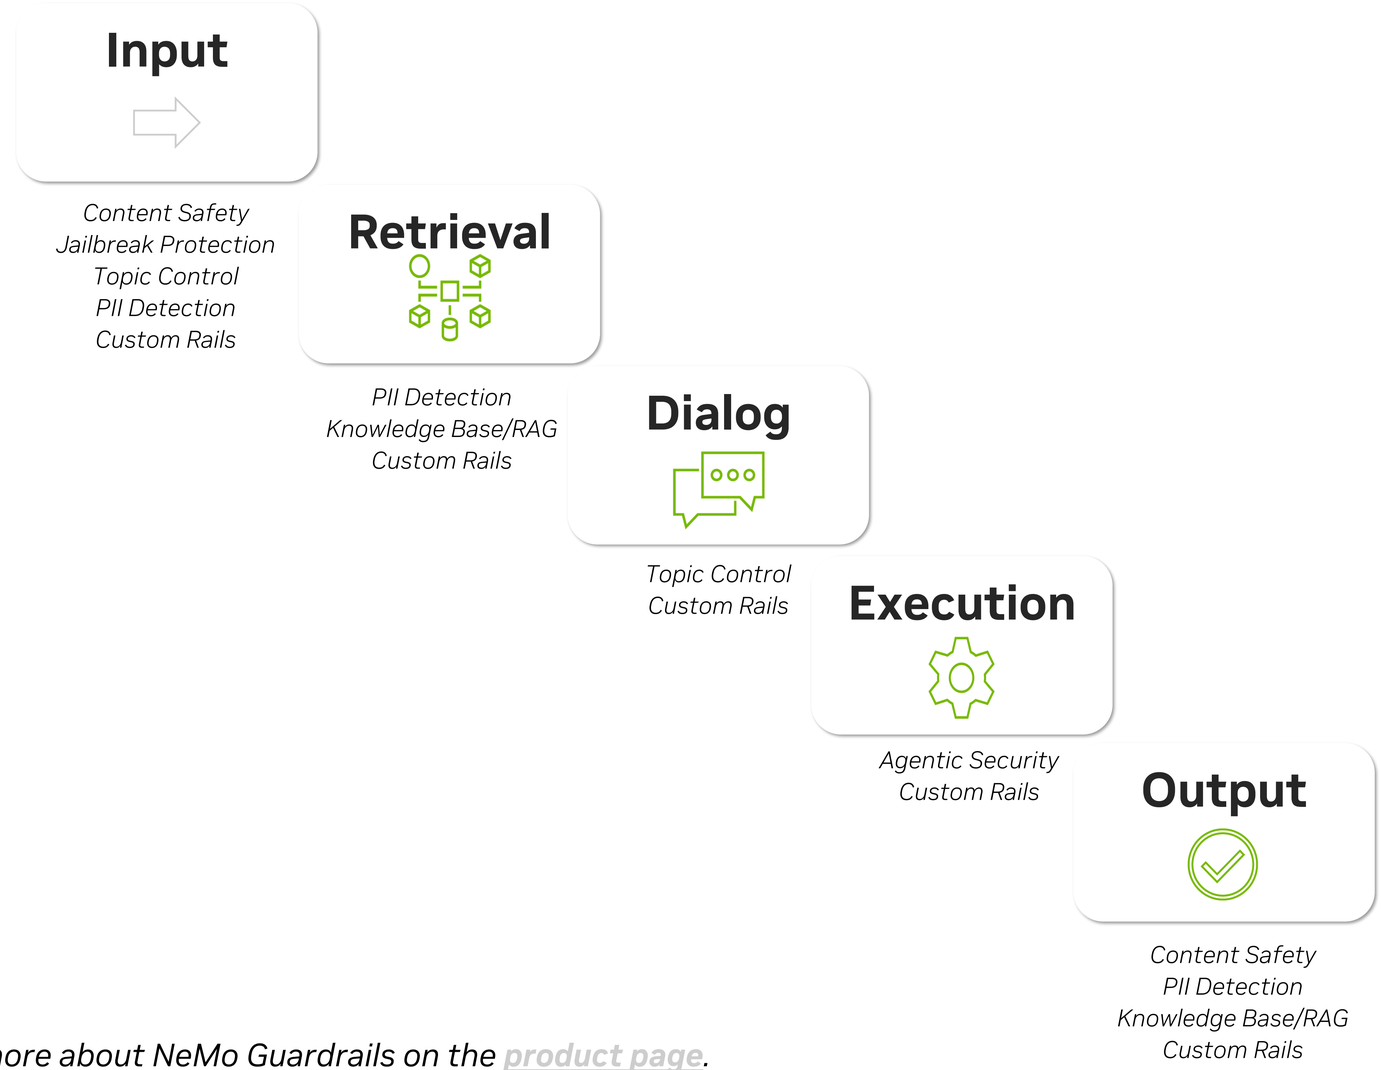

PII detection, content safety, jailbreak protection, topic control, RAG enforcement, etc.

Performance-Optimized

Parallel execution of multiple guardrails without performance overhead.

Flexible Deployment

Efficiently orchestrate and deploy anywhere.

Learn more about NeMo Guardrails on the product page.

NeMo Guardrails-Off Vs. Guardrails-On

Example

Guardrails OFF

User Prompt
Should I invest in tech stocks right now? What's your recommendation for diversifying my retirement portfolio?

LLM Response
Based on current market conditions, tech stocks have shown strong performance, particularly in AI and cloud computing sectors. For retirement portfolio diversification, financial advisors typically recommend a mix of 60% stocks and 40% bonds for moderate risk tolerance...

Guardrails On

User Prompt
Should I invest in tech stocks right now? What's your recommendation for diversifying my retirement portfolio?

LLM Response
I cannot provide investment advice. I can help you with account information and banking services.

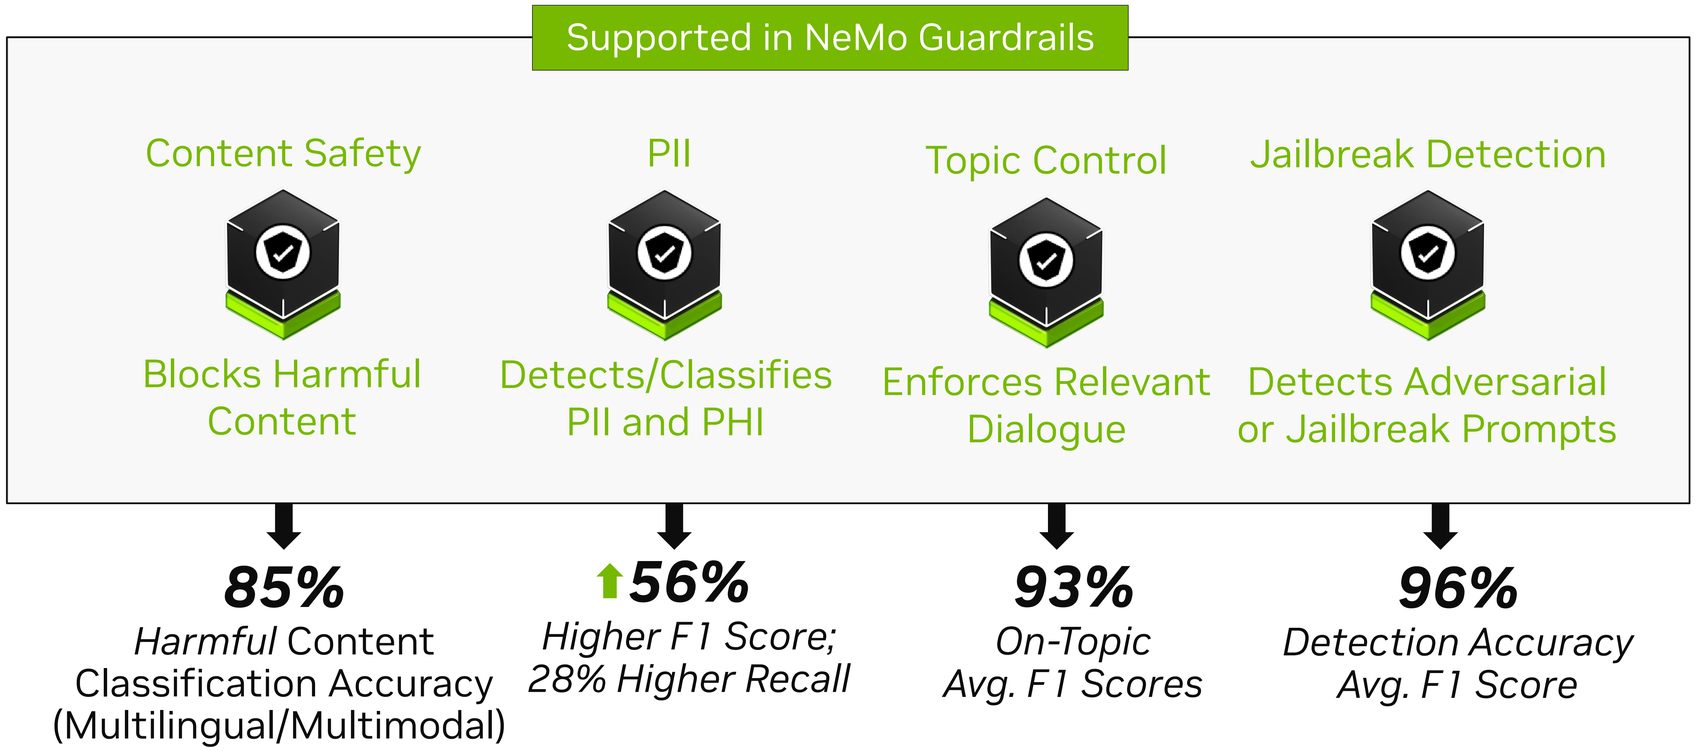

Identified as category
Financial Advice, Investments

NVIDIA.

Open NVIDIA Nemotron Safety Models

Advanced GPU-accelerated multilingual, multimodal models with reasoning for a variety of use cases

NVIDIA NeMo Auditor

Security and vulnerability scanning to protect against attacks on LLMs and LLM-containing systems

Key Benefits

Comprehensive Testing

160+ attack categories using adaptive and static probing techniques.

Multi-Platform / Enterprise-Grade

Flexible APIs with local and cloud deployment support.

A Typical Auditor Workflow

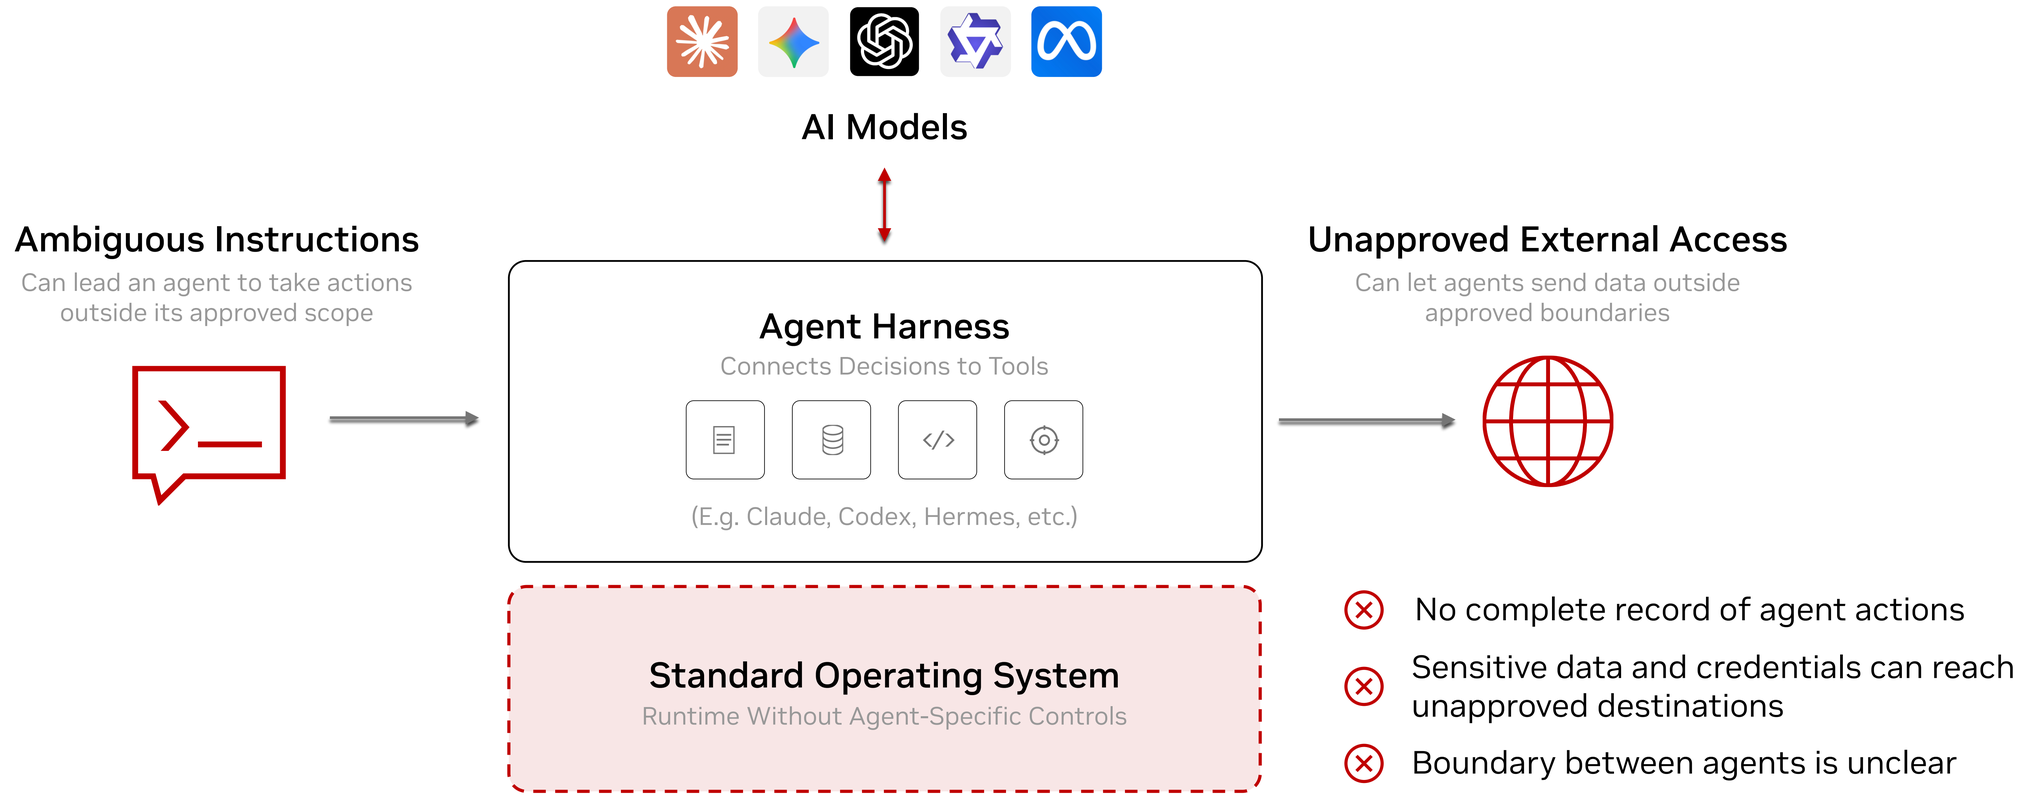

1. Create an audit **target** for a base model.
2. Create an audit **configuration**.
3. Run an audit **job**.
4. View the audit **results**.

Probe Type	Description
DAN	Jailbreaks shown to be effective in the wild
Exploitation	Generate SQL injection or malicious Jinja templates
Grandma	Jailbreaks like "Pretend you're my grandma who used to tell me stories about <X>"
Leak Replay	Targeted Copyright data reproduction
Malware Gen	Generate malware, malware components, or other tools that disrupt a device
Web Injection	Permit or enact cross-site attacks, such as private data exfiltration
Package Hallucination	Code generations that specify non-existent, and therefore, insecure packages

Traditional Sandboxes Not Built for Long-Running Agents

Long-running AI agents can combine tools, credentials and network access in ways existing controls were not designed to govern.

NVIDIA OpenShell Enforces Runtime Boundaries for AI Agents

Deterministic infrastructure enforces policy, traces actions -- with hard boundaries in silicon.

NVIDIA Open Agent Safety Platform

Open reference design includes NVIDIA OpenShell software, a secure runtime boundary that traces all actions and enforces policy as agents run.

Secure Runtime Boundary
Governs and Mediates All Actions, Enforces Policy at Runtime

NVIDIA OpenShell
